

UX CASE STUDY

CardFlow: Corporate Card Governance Platform

Designing a corporate card governance platform for controlled, compliant, and scalable spending

OVERVIEW

What is CardFlow?

CardFlow is a corporate card governance platform designed to help finance and operations teams manage employee card usage with better visibility, control, and compliance.

The platform enables organizations to issue, monitor, and govern corporate cards while reducing misuse, manual reconciliation, and policy violations.

INDUSTRY

Fintech / Enterprise Finance

USERS

Finance Teams, Admins, Employees

PLATFORM

Web (Enterprise SaaS)

MY ROLE

Lead UX Designer (end-to-end)

PROBLEM STATEMENT

The Challenge

As organizations scaled, managing corporate card usage became increasingly complex.

Finance teams faced:

- ⚠ Limited visibility into real-time spending
- ⚠ Manual approval and reconciliation workflows
- ⚠ High risk of policy violations and misuse
- ⚠ Poor audit readiness and fragmented reporting

Existing tools were either too rigid or overly complex, making governance difficult without slowing teams down.

My Role & Responsibilities

I led UX design end-to-end, collaborating closely with product, engineering, and finance stakeholders.

My responsibilities included:

- ✔ Understanding finance and compliance workflows
- ✔ Designing end-to-end card management flows
- ✔ Iterating designs based on regulatory and technical constraints
- ✔ Mapping user roles and permission models
- ✔ Defining information architecture and dashboards
- ✔ Supporting implementation and design handoff

Users & Key Insights

Finance Managers

Oversee spending, approvals, and compliance

Admins

Manage card issuance, limits, and policies

Employees

Use cards for day-to-day business expenses

Key Insights

- Finance teams needed real-time visibility, not post-spend reports
- Manual approvals slowed teams and increased errors
- Different roles required different levels of control and access
- Policy enforcement needed to be flexible, not one-size-fits-all
- Audit preparation was a recurring pain point

These insights shaped both the feature set and permission structure.

Design Challenge

How might we enable strong financial governance without adding friction for employees and finance teams?

The solution needed to balance:

Control

VS

Autonomy

Compliance

VS

Speed

Flexibility

VS

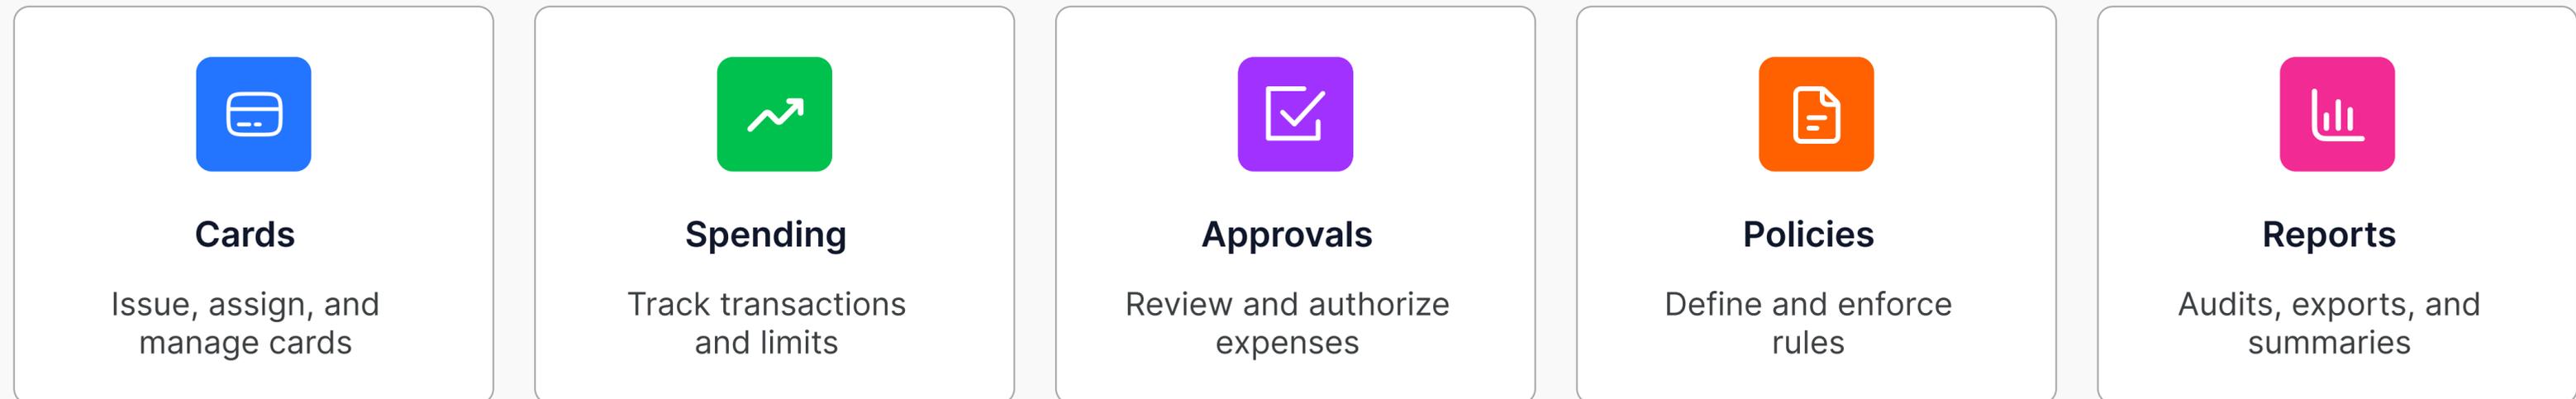

Standardization

Information Architecture

The platform was structured around core finance workflows, rather than individual features.

Key IA Decisions

Grouped functionality by intent:

This structure reduced cognitive load and made governance tasks easier to manage at scale.

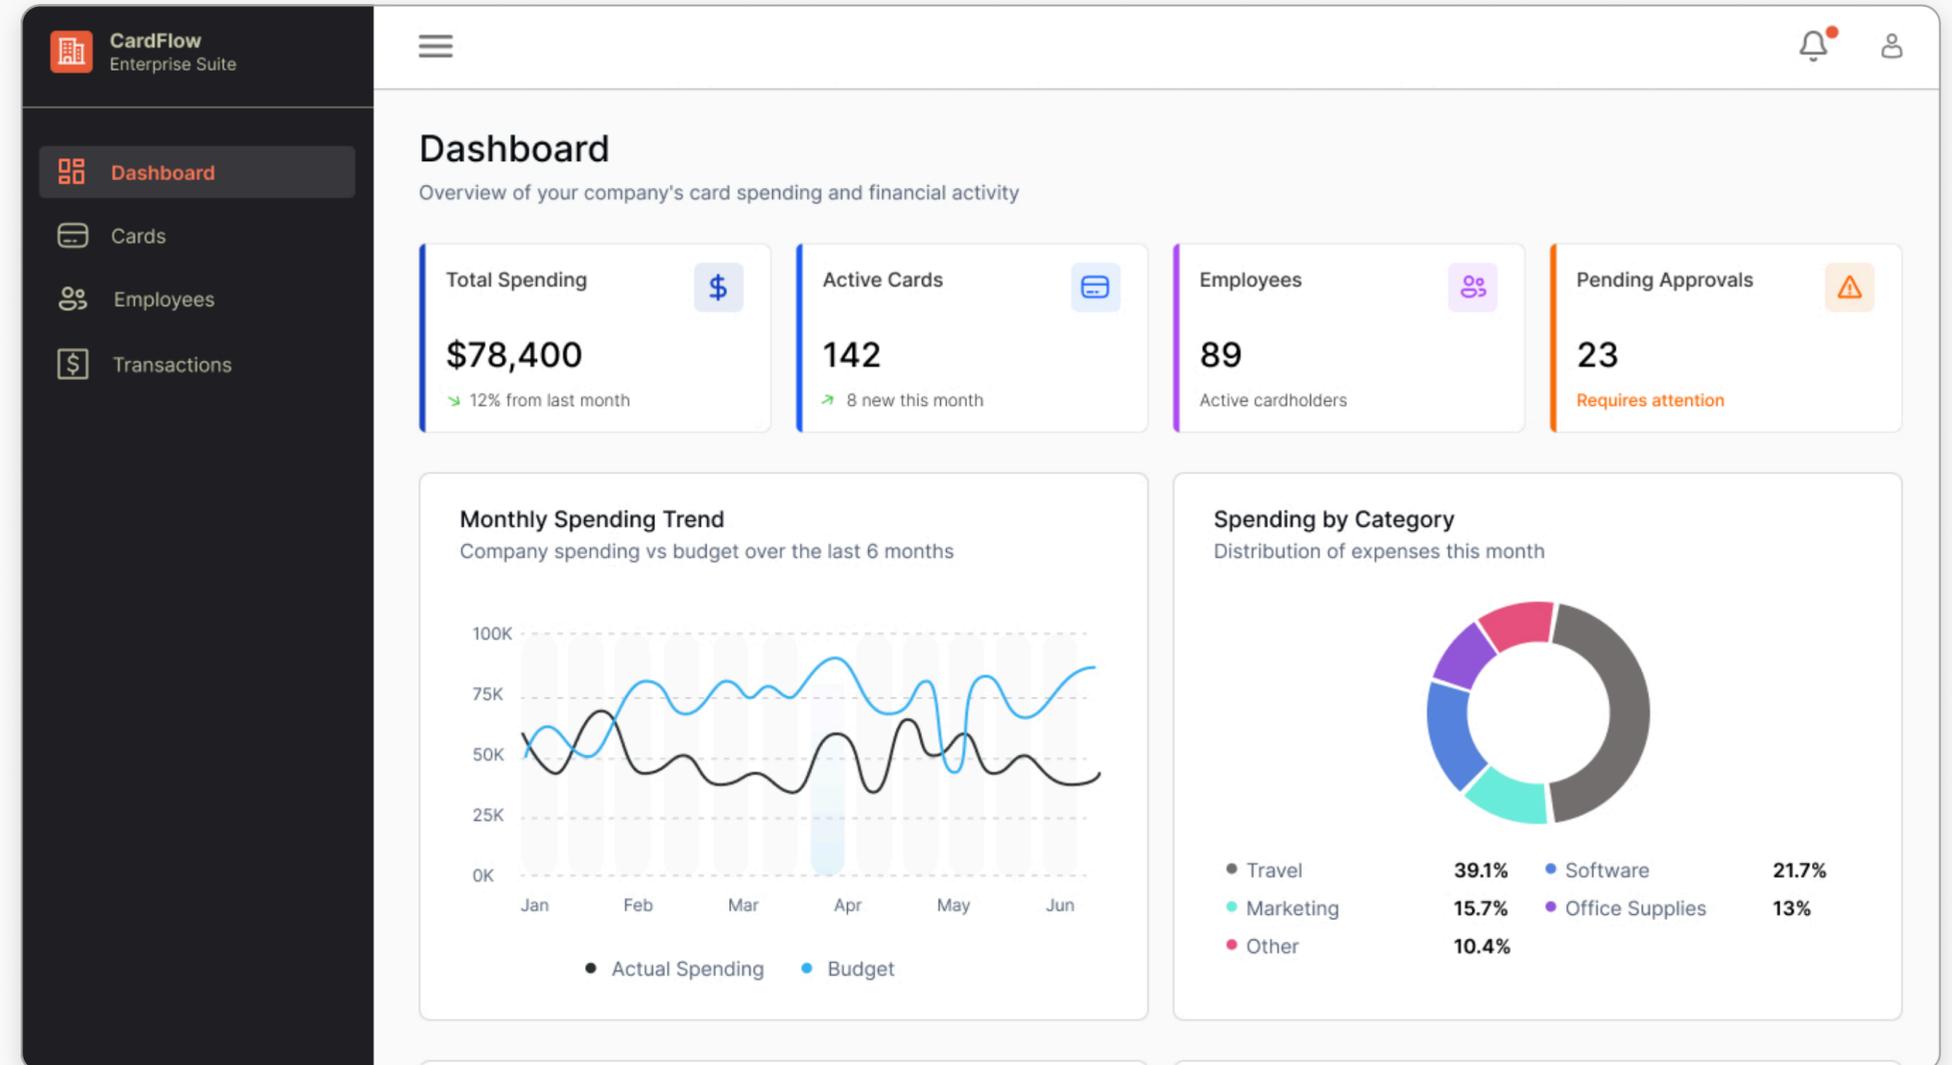

Core User Flows

USER FLOW 01

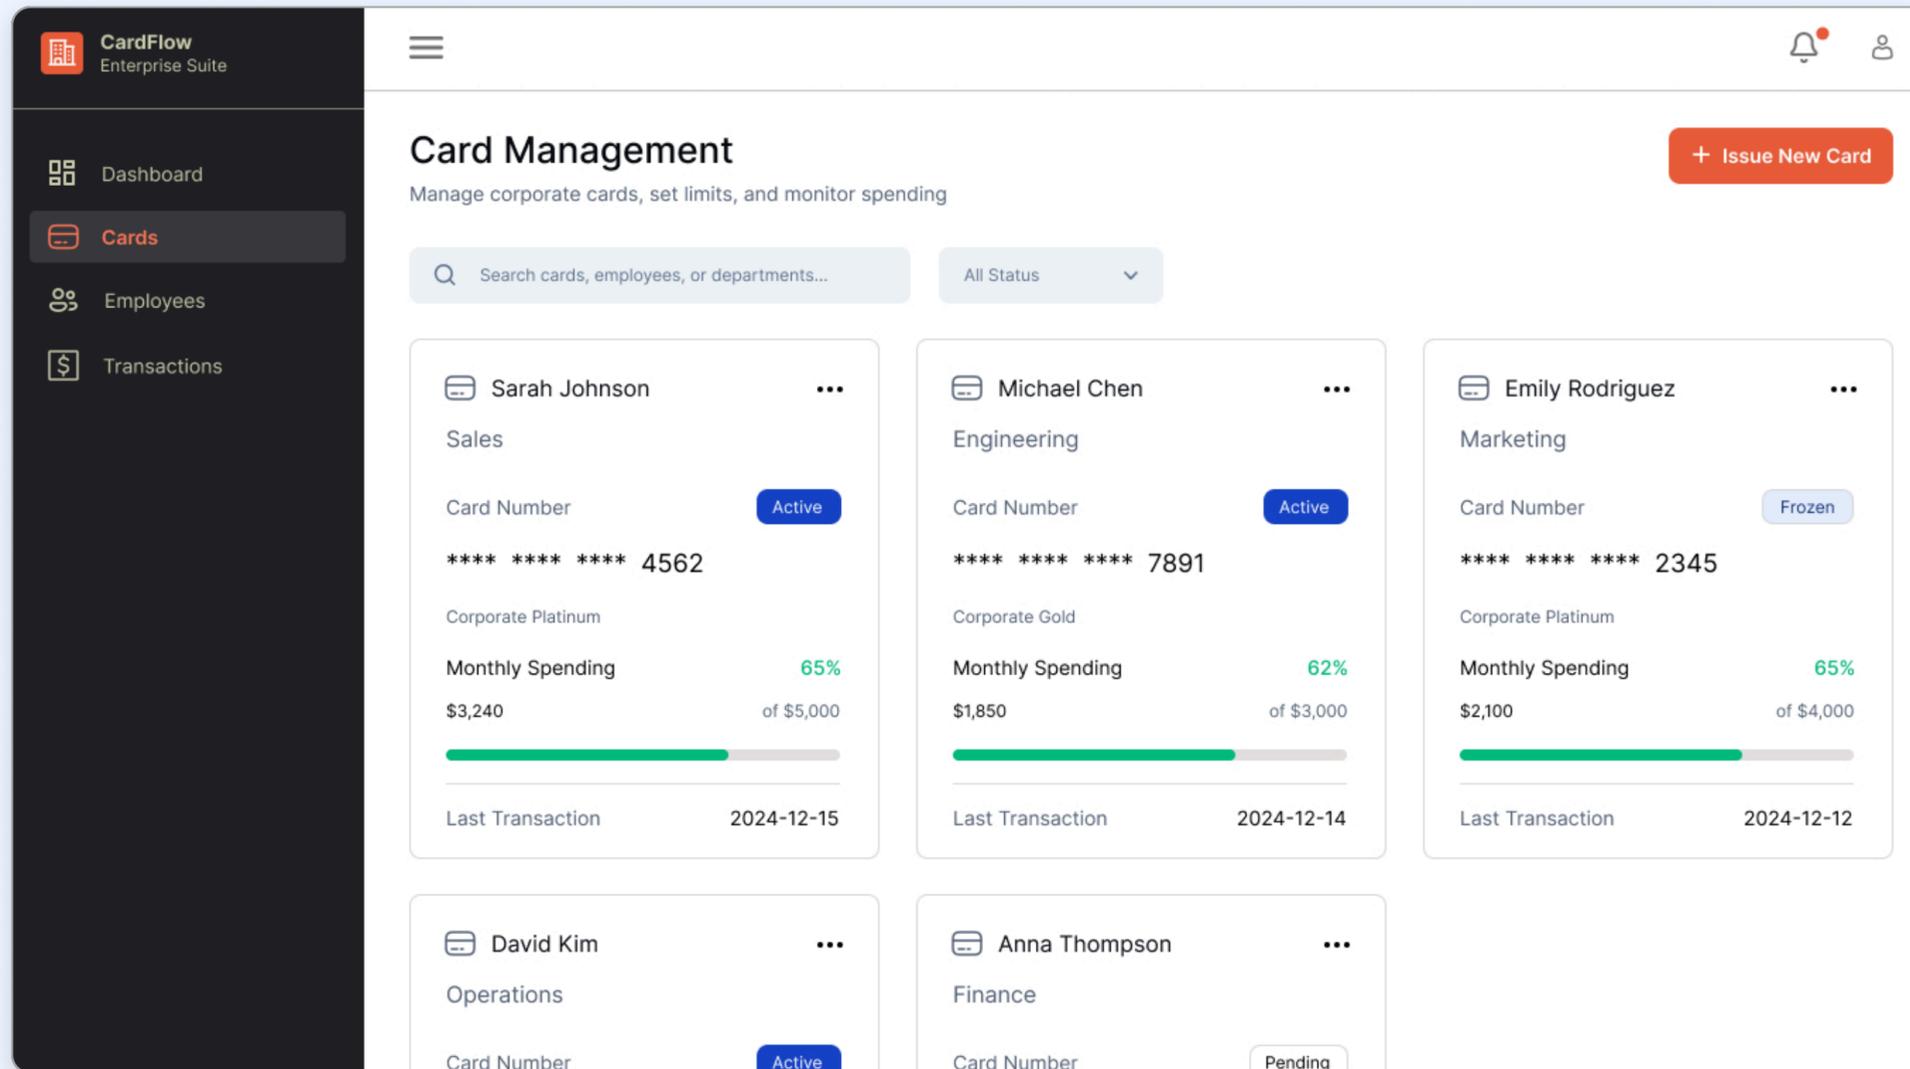

Dashboard & Real-Time Visibility

Finance teams needed immediate insight into company-wide card activity and spending patterns.

- At-a-glance metrics for spending and cards
- Monthly trends with budget comparison
- Category breakdown for expense analysis
- Visual indicators for items requiring attention

This reduced reliance on manual reconciliation and spreadsheets.

The focus was on clarity and preventing configuration errors upfront.

USER FLOW 02

Card Issuance & Configuration

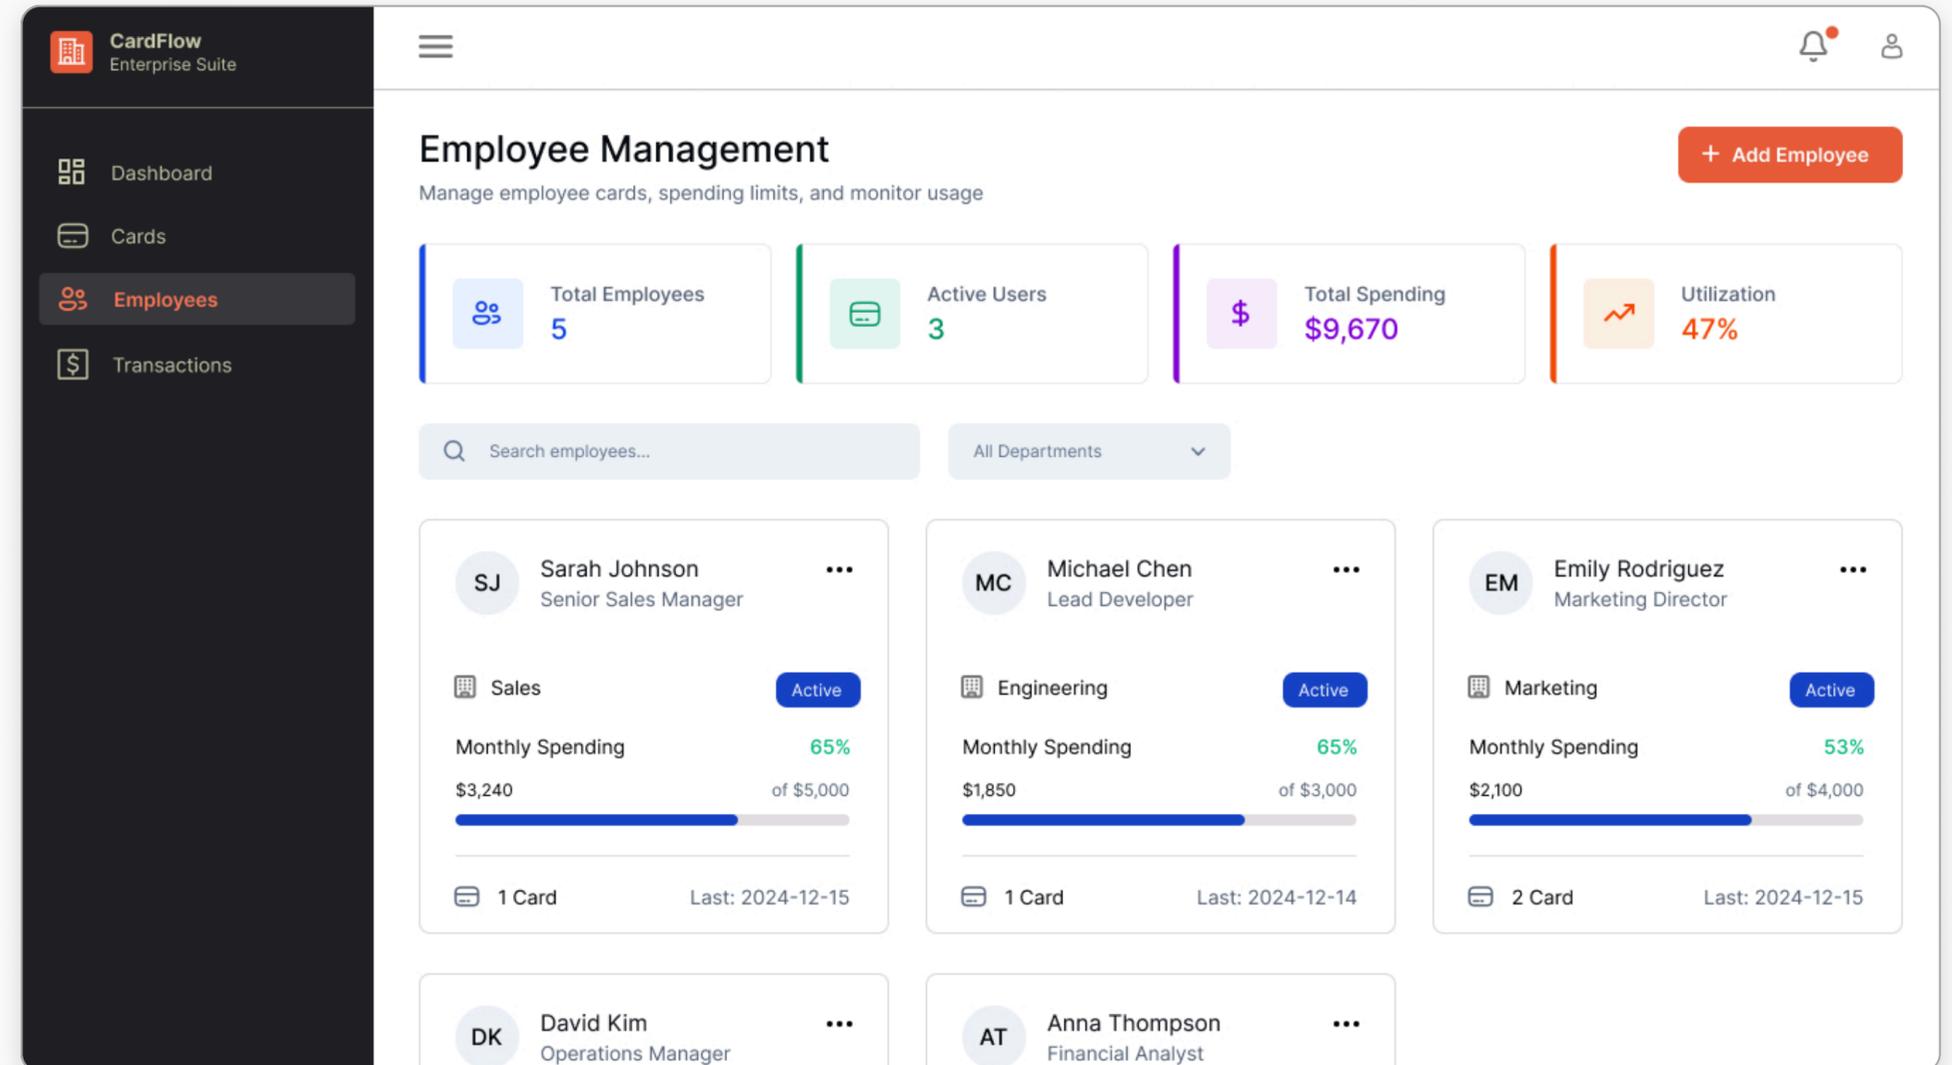

Admins needed the ability to quickly create and assign cards with granular control over limits and restrictions.

- Create and assign cards quickly
- Define spending limits and merchant restrictions
- Set validity periods and usage rules
- Monitor card status and spending in real-time

Employee & Card Assignment

Finance teams needed to manage employee access, spending limits, and card assignments from a centralized view.

- Overview of all employees with card access
- Individual spending metrics and utilization rates
- Department-based filtering and organization
- Quick access to employee details and card management

Save Employee

Add New Employee

Enter employee details and configure card settings

Personal Information

Basic employee details

First Name * John
Last Name * Doe
Email Address * john.doe@comapny.com
Phone Number * +1 (555) 0123
Employee ID EMP - 1234
Start Date * mm/dd/yyyy

Card Settings

Configure card and spending limits

Monthly Spending Limit * \$ 5000
Maximum amount the employee can spend per month

Card Issue Create a card for this employee

Card Type * Select card type

Work Information

Department and role details

Department * Select department
Role/Position * Senior Manager

Summary

Employee Name: -
Department: -

USER FLOW 04

Employee Onboarding

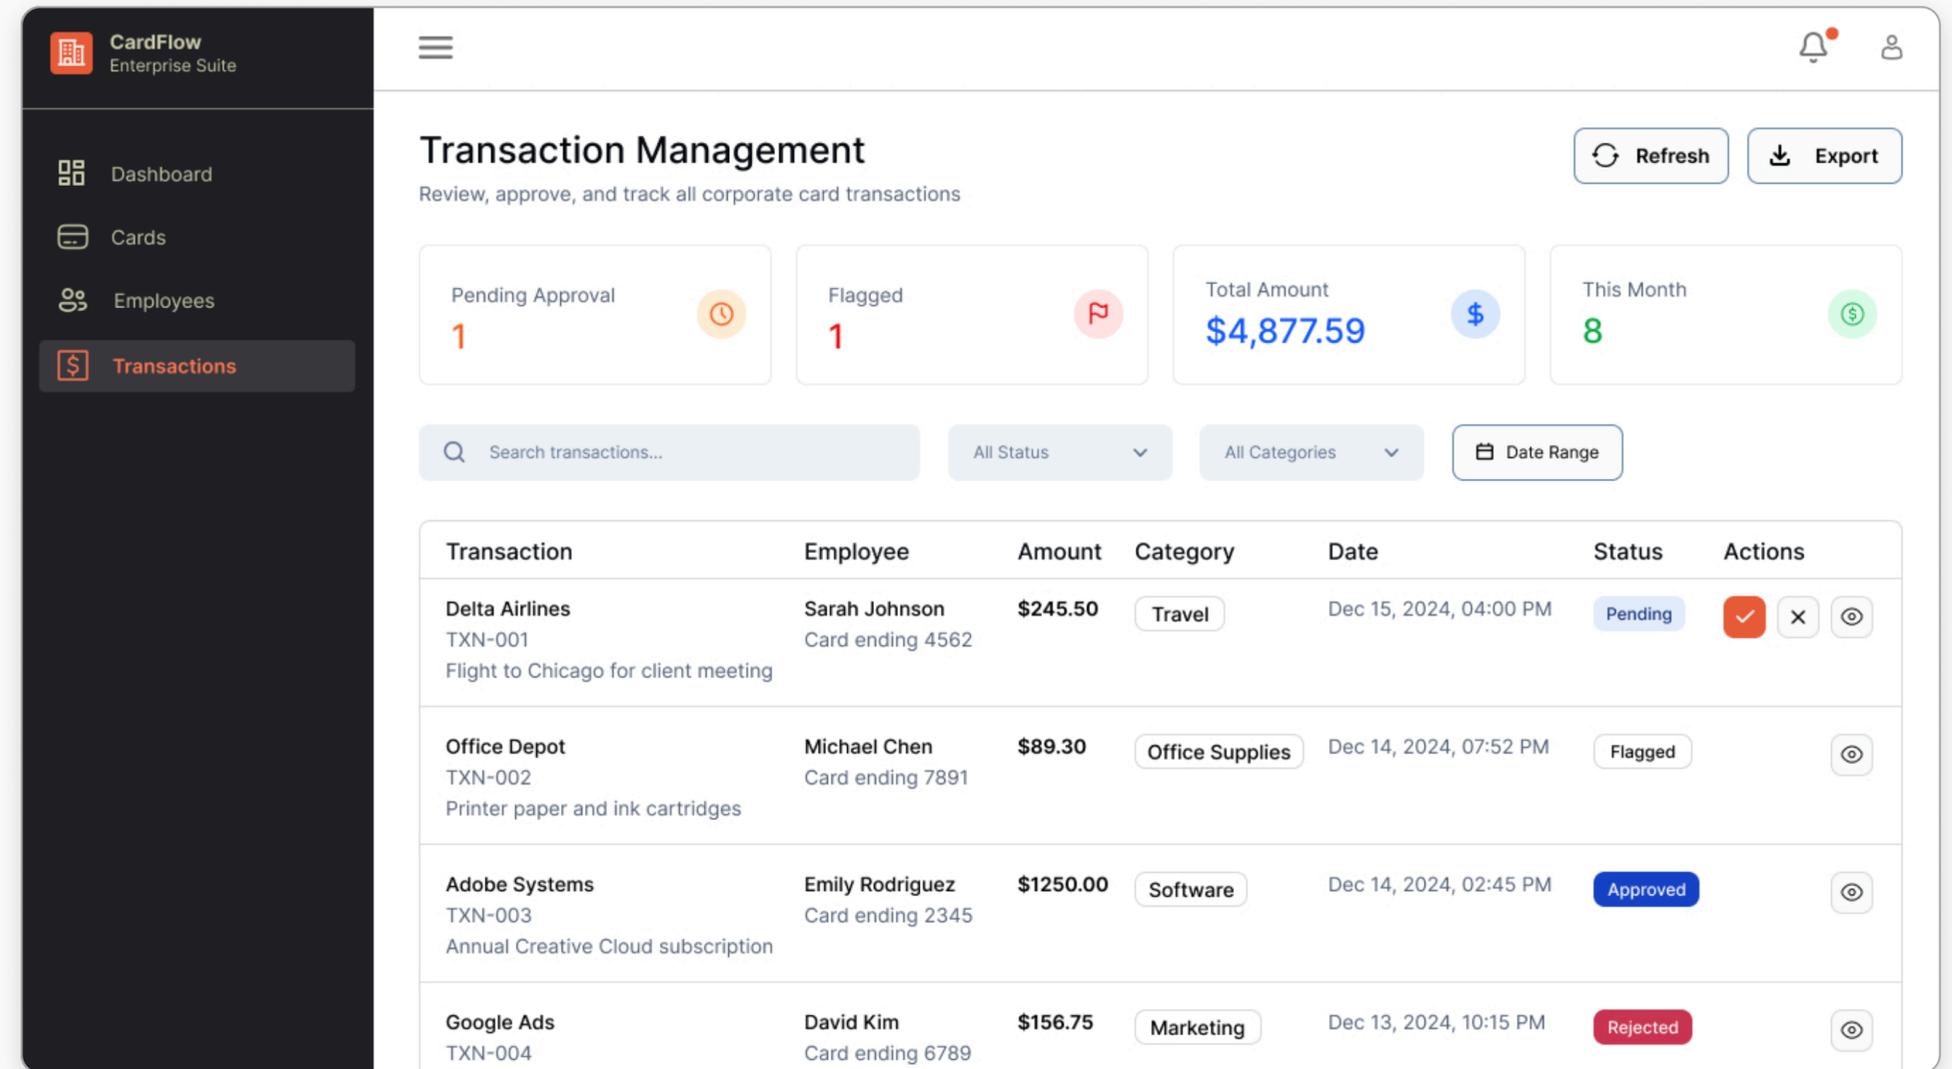

The employee creation flow combined personal information, work details, and card settings in a single, streamlined interface.

- Grouped related fields into clear sections
- Real-time summary panel to preview configuration
- Optional card issuance during employee creation
- Clear validation and helpful placeholder text

Transaction Monitoring

Finance teams needed comprehensive transaction visibility with efficient approval workflows.

- Real-time transaction feed with filtering options
- Clear status indicators (pending, flagged, approved, rejected)
- Quick action buttons for approval workflows
- Detailed transaction context including employee, amount, and category
- Export functionality for reporting and audits

This allowed governance without micromanagement and significantly reduced audit preparation effort.

Visual Design Approach

The visual system emphasized trust, clarity, and efficiency.

Design Principles

Clean, neutral color palette

Grays and whites establish trust and professionalism, with strategic color for status indicators

Clear hierarchy for financial data

Typography and spacing guide attention to critical information and actions

Consistent table and filter patterns

Repeated patterns reduce learning curve across different sections

Visual cues for risk and compliance states

Color-coded badges and icons communicate status at a glance

The interface was designed for frequent use by finance professionals in high-pressure operational environments.

Collaboration & Constraints

Worked closely with finance stakeholders to validate workflows

Designed within regulatory and compliance constraints

Partnered with engineering to ensure real-time data accuracy

Iterated designs based on edge cases and error scenarios

This collaboration helped align usability with compliance requirements.

Outcome & Impact

The CardFlow platform:

Improved real-time visibility

Finance teams gained immediate insight into corporate spending patterns

Reduced manual effort

Automated approval workflows and reconciliation processes

Enhanced policy enforcement

Organizations could enforce policies without slowing teams

Increased audit confidence

Comprehensive audit trails and reporting capabilities

The platform successfully supported governance at scale.

Key Learnings

Learning 1

Governance tools must feel empowering, not restrictive

Learning 2

Role-based access is critical in financial systems

Learning 3

Clear exception handling builds user trust

Learning 4

Designing for compliance requires deep domain understanding

FINAL NOTE

This project strengthened my approach to fintech and enterprise UX:
designing systems that enable control while preserving usability and speed.
